

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the Application:

Listing of Claims:

1. (Currently Amended) A component (2), ~~in particular a sun visor (2)~~ that is designed for use in a vehicle, ~~the component (2)~~ comprising: a structural part (3) and a cover element (1), the cover element (1) being connected to the structural part (3) by ~~means of a~~ removable connection, ~~characterized in so~~ that a connecting movement (26) of the cover element (1) relative to the structural part (3) is provided to produce the connection, in a direction (25) substantially tangential to at least one main extension direction (250) of the cover element (1).
2. (Currently Amended) The component (2) as claimed in claim 1, ~~characterized in that~~ wherein the cover element (1) has at least one main extension direction (250), substantially in a plane (240) and ~~in that~~ the connecting movement (26) is carried out substantially in the plane (240).
3. (Currently Amended) The component (2) as claimed in claim 1, ~~characterized in that~~ wherein the cover element (1) has at least one main extension direction (250), substantially in a cylindrical peripheral surface and ~~in that~~ the connecting movement (26) is substantially carried out in the cylindrical peripheral surface.
4. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 3, further comprising at least one first sliding element (16, 17, 18) ~~of on one of~~ the structural part (3) ~~or of~~ and the cover element (1) is arranged in the plane (240) or in the cylindrical peripheral surface.
5. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 4, wherein the at least one first sliding element (16, 17, 18) cooperates with at least one second sliding element (19, 20, 21) for locking the cover element (1) relative to the structural part (3), at least relative to a movement perpendicular to the plane (240) or to the cylindrical peripheral surface.

6. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 3, further comprising a snap-in connection (22, 23) is provided between the cover element (1) and the structural part (3) for locking the cover element (1) relative to the structural part (3), relative to a movement in the plane (240) or in the cylindrical peripheral surface.

7. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 6, wherein the snap-in connection (22, 23) is reversibly removable.

8. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 6, wherein the snap-in connection (22, 23) is only irreversibly removable.

9. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 1, wherein the cover element (1) is provided in the manner of a frame.

10. (Currently Amended) The component (2) as claimed in ~~one of the preceding claims, characterized in that~~ claim 1, wherein the component (2) is a sun visor (2) with a mirror (10), the cover element (1) being provided at least for covering ~~the~~ an edge region of the mirror (10).

11. (Currently Amended) A method for producing a component for use in a vehicle, comprising: (2), in particular as claimed in one of the preceding claims, characterized in that

providing a structural part and a cover element;

arranging the cover element (1) and the structural part (3) are arranged, in a first step, relative to one another such that the at least one first sliding element (16, 17, 18) on one of the cover element and the structural part and the at least one second sliding element (19, 20, 24) on the other of the cover element and the structural part are at least partially in contact;
and

in that a connecting movement (26) of the cover element (1) relative to the structural part (3) is carried out, in a second step, by a connecting movement in a direction substantially tangential to at least one main extension direction (250) of the cover element (1).

12. (New) The method of claim 11, wherein the component is a sun visor with a mirror, the cover element being provided at least for covering an edge region of the mirror.

13. (New) The method of claim 11, wherein the at least one first sliding element comprises a first set of three sliding elements, and the at least one second sliding element comprises a second set of three sliding elements, and the first set and the second set are configured to be connected respectively by the connecting movement.

14. (New) A sun visor for use in a vehicle, comprising:
a structural part having a first set of sliding elements disposed on a first side of the structural part;
at least one of a body part and a decorative material overlying at least a portion of the first side of the structural part; and
a cover element overlying one of the body part and the decorative material, the cover element having a second set of sliding elements configured to interconnect with the first set of sliding elements to couple the cover element to the structural part with at least one of the body part and the decorative material therebetween.

15. (New) The sun visor of claim 14, wherein the first set of sliding elements and the second set of sliding elements are arranged to be coupled by a connecting movement of one of the cover element and the structural part, relative to the other, the connecting movement being carried out in a plane of one of the cover element and the structural part.

16. (New) The sun visor of claim 15 wherein the connecting movement is carried out in a direction substantially tangential to at least one main extension direction of the cover element.

17. (New) The sun visor of claim 16 wherein the cover element and the structural part are coupled to one another by a snap-in connection by the connecting movement.

18. (New) The sun visor of claim 17 wherein the snap-in connection is reversibly removable.

19. (New) The sun visor of claim 17 wherein the snap-in connection is irreversibly removable.

20. (New) The sun visor of claim 17 further comprising a mirror, the mirror having an edge region at least partially covered by the cover element.
